

Platform and card flows

How Klippi works

A plain description of the Klippi loyalty platform: the three roles, the three card types, and the exact step-by-step flows for stamp cards, gift cards and store credit. Written so a person or an AI build agent can understand and build it.

Klippi is a loyalty platform for restaurants, cafés and other stores. Customers keep digital cards in Apple Wallet or Google Wallet, so they never lose their stamping progress. Every card a customer claims also gives the store the customer's name and phone number, which the store uses for SMS marketing.

Roles

Three people touch the system

CUSTOMER

Holds cards in the wallet

Claims a card by scanning a QR code and entering name and phone number. Shows the card's QR code at the counter to get stamps or pay with a balance.

CASHIER

Uses the Tikki app

The home screen has two buttons: **Scan** and **Create card**. Scan opens a card's profile to add stamps or deduct an amount. Create card issues a Gjafakort or Inneignarkort.

MANAGER

Runs the Klippi backend

Designs the stamp card, creates the stand with the QR code for customers, sees every card ever created, and uses collected phone numbers for SMS marketing.

Card types

Three kinds of cards a store can create

01

Stamp card

Stamps on purchases. A full card earns something free or a discount. Claimed from the stand at the counter.

02

Gjafakort (gift card)

A prepaid amount. Delivered on screen, by email, or as a physical card with a reference code. Redeemed by deducting from the balance.

03

Inneignarkort (store credit)

Credit issued when an item is returned, matching the printed inneignarnóta. Redeemed like a gift card.

Building blocks

What the platform is made of

Klippi backend	Web app for the manager. Card design, stand and QR creation, list of all cards, customer database.
Tikki app	Cashier's phone app. Two actions: Scan a card, or Create a card.
Wallet cards	Apple Wallet and Google Wallet passes, each with its own QR code. They update automatically when stamps or balances change.
Receiving flow	The web page a customer lands on after scanning. Asks for name and phone number, then releases the card into the wallet.
Claim pages	A store subpage such as giftcard.mettasport.is , which Klippi sets up for each client, or klippi.is/giftcard . Used to claim a physical gift card with full name, phone number and reference code.
Customer database	Name and phone number (and email when used) saved on every claim. Used for SMS about new offers, drops and limited deals.

TIKKI HOME SCREEN

Scan

Create card

Rule that applies to every card type: a card is only released after the customer enters name and phone number. Claiming a card and giving the store a marketing contact are the same action.

Flow 01

Stamp card

The core loyalty loop. The manager designs the card once, customers claim it from a stand at the counter, and the cashier adds stamps by scanning the card.

01

MANAGER

Design the card and create the stand

In the Klippi backend the manager designs the stamp card, then creates a stand with a QR code that customers can scan at the counter.

02

CUSTOMER

Claim the card into the wallet

The customer scans the stand's QR code and enters the receiving flow: name and phone number. The card is then released into Apple Wallet or Google Wallet, and the phone number is saved to the store's database.

03

CASHIER

Add a stamp on purchase

The cashier opens Tikki, taps **Scan** and scans the QR code on the customer's card. The card profile opens and the cashier adds stamps to that customer.

04

SYSTEM

Card updates automatically

The card in the customer's wallet updates on its own with the new stamp count.

05

CUSTOMER

Earn the reward

When the card is full the customer gets something free or at a discount.

06

MANAGER

SMS marketing

The store uses the phone numbers collected through claims to send SMS about new offers, drops and limited deals.

Flow 02

Gjafakort (gift card)

Payment happens on the store's own terminal. Klippi creates the card, delivers it in one of three ways, and later deducts purchases from its balance.

A · CREATE

01

CUSTOMER · CASHIER

Pay for the gift card

The customer asks for a gift card. The cashier asks for the amount, enters it into the payment terminal, and the customer pays.

02

CASHIER

Create the card in Tikki

Create card → **Gjafakort** → enter the amount → **Create**. A unique card is created and is always visible in the Klippi backend.

03

CASHIER

Choose how to deliver it

The cashier asks whether to display the card now, send it by email, or produce a physical card. Three options, described below.

B · DELIVER

OPTION 1

Display now

A QR code fills the cashier's screen. The customer scans it, enters name and phone number in the receiving flow, and the card lands in their wallet. The customer's details are saved.

OPTION 2

Send via email

The cashier types the customer's email address in the app and sends the card.

OPTION 3

Reference code (physical gift)

A 5-character code of letters and numbers appears. The cashier takes a pre-printed physical gift card from the cabinet, fills in the two blanks (amount and the 5-box code), and packs it in an envelope. Claim instructions are printed at the bottom of the card.

Claiming a physical card. The recipient goes to the store's claim page, for example giftcard.mettasport.is, or to klippi.is/giftcard, and fills in three fields: full name, phone number, reference code. Every reference code is unique across all stores, so klippi.is/giftcard always resolves the right card. Claiming releases the card to the wallet and saves the recipient's details for marketing.

Flow 02 · continued

Gjafakort: redeem

Later visits. The gift card works like a balance that the cashier deducts from by scanning the card.

C · REDEEM

01

CASHIER

Total the purchase

Scan the items and note the total amount.

02

CASHIER

Scan the gift card

Tikki → **Scan** → scan the QR code on the customer's gift card. The gift card profile appears.

03

CASHIER · SYSTEM

Deduct and confirm

Deduct the purchase amount from the balance and tap **Confirm**. The card in the wallet updates automatically.

Flow 03

Inneignarkort (store credit)

For stores with a store-credit policy on returns. The credit follows the printed inneignarnóta and is redeemed like a gift card.

01

CUSTOMER · CASHIER

Return the item

The customer returns an item. The cashier scans it, sees the amount it cost, and prints the inneignarnóta.

02

CASHIER

Create the credit card

Tikki → **Create card** → **Inneignarkort** → enter the amount from the inneignarnóta.

03

CASHIER

Deliver

Display now (customer scans the QR code and claims it) or **Send via email**.

04

CASHIER · SYSTEM

Redeem on the next visit

Scan the Inneignarkort QR code, edit the balance in the card profile, confirm. The card updates

Build summary

What has to exist

Everything above, condensed into the screens, data, lifecycle and rules an implementation needs to cover.

Tikki app screens	Home (Scan, Create card) · Scan → Card profile with add stamps, deduct amount, Confirm · Create card → Gjafakort or Inneignarkort → amount → Create → Display now, Send via email, Reference code (Gjafakort only).
Web screens	Manager backend (design card, create stand and QR, list of all cards, customers) · Receiving flow (name, phone → release card to wallet) · Claim page (full name, phone, reference code), per store or at klippi.is/giftcard.
Data	Store · Manager · Cashier · Card template (design) · Card (type: stamp, gift or credit; stamp count or balance; unique reference code; QR; status) · Customer (name, phone, email) · History of stamps and deductions.
Card lifecycle	Created → delivered (display now, email, or reference code) → claimed with name and phone → in the wallet → updated on each scan (stamp added or amount deducted) → full or empty.
Integrations	Apple Wallet and Google Wallet passes with automatic updates · QR code on every card · SMS sending · Email delivery. Payment stays on the store's terminal, outside Klippi.

Rules

Things that are always true

- | | |
|---|--|
| <ul style="list-style-type: none"> - A card is released only after name and phone number are entered | <ul style="list-style-type: none"> - Wallet cards update automatically after every change |
| <ul style="list-style-type: none"> - Every card has its own unique reference code, across all stores | <ul style="list-style-type: none"> - Every created card is visible in the Klippi backend |
| <ul style="list-style-type: none"> - Reference codes are 5 characters, letters and numbers | <ul style="list-style-type: none"> - Reference code delivery exists for Gjafakort only |
